

Statement of Verification

BREG EN EPD No.: 000518

Issue 03

This is to verify that the
Environmental Product Declaration
provided by:
Mayflex UK Limited

is in accordance with the requirements of:
EN 15804:2012+A2:2019

and

BRE Global Scheme Document SD207

This declaration is for:

**1 metre of Excel Shielded Solid Conductor CAT6, CAT6A & CAT7A
4-pair Ethernet cables.**

Company Address

Mayflex UK Limited
Unit 15,
Junction Six Industrial Park,
Electric Avenue
Birmingham
B6 7JJ

A handwritten signature in black ink, appearing to read 'E Baker'.

Signed for BRE Global Ltd

Emma Baker
Operator

Construction Product:

Product Description

Excel solid conductor CAT6, CAT6A & CAT7A shielded LSOH CPR Euroclass & UKCA compliant 4-pair Ethernet cables - designed and manufactured to meet and exceed the ISO, CENELEC and TIA standards and supplied in 305m REELEX® boxes or on 500m or 1000m reels. The cables deliver Class E, Class EA or Class FA performance over distances of up to 90 metres and support applications up to 10GBASE-T, 10 Gigabit Ethernet. Available in a range of colours. This range of shielded Cables covers several different shield types – U/FTP, F/UTP, F/FTP and S/FTP, depending on the construction. Each cable consists of four twisted pairs of conductors, which are extruded into a single cable and wrapped with one or two screening layers. The screening layers – depending on the construction – consist of aluminium/polyester foils and for braided wire. The individual pairs are set at different twist ratios within the cable to ensure optimum performance and reduce NEXT. The combination of Aluminium foils and for braiding also contribute to excellent NEXT and Alien Crosstalk performance across this range of cables. In this EPD, Cat6A Cable U/FTP LSOH CPR Euroclass B2ca 305m - Box Ice Blue with the weight of 0.063 kg/m has been taken as a representative among their group.

Product name:	Item Code / Colour	Weight (kg/m)
Excel Dual Cat6A Cable S/FTP LSOH CPR Euroclass Dca 500m	100-915 – White	0.052
Excel Solid Cat6 Cable F/UTP LSOH CPR Euroclass B2ca 305m	190-076 - Violet	0.058
Excel Solid Cat6A Cable F/FTP LSOH CPR Euroclass Dca 500 m	100-996 - Ice Blue	0.052
Excel Solid Cat6A Cable F/FTP LSOH CPR Euroclass B2ca 500m	190-996 - Ice Blue	0.053
Excel Solid Cat6A Cable S/FTP LSOH CPR Euroclass Dca 500m	100-914 - White	0.053
Excel Solid Cat6A Cable S/FTP LSOH CPR Euroclass B2ca 500m	190-914 - White	0.053
Excel Solid Cat6A Cable U/FTP S-Foil LSOH CPR Euroclass Dca 500m	100-191 - Ice Blue	0.053
Product name:	Item Code / Colour	Weight (kg/m)

Excel Solid Cat7A Cable S/FTP B2ca LSOH 1000m	190-910-1000M - Yellow	0.055

Technical Information

Property	190-076	190-910 and 190-910-1000M
Screen Type	F/UTP	S/FTP
CPR Rating	B2ca s1a d1 a1	B2ca s1a d1 a1
Single/Dual	Single	Single
Colour	Violet	Yellow
Conductor AWG	23	23
No. of Conductors	8	8
Conductor Insulation	PE	PE
Sheath Material	Co-Polymer LSOH	Co-Polymer LSOH
Cable Diameter	7.6mm	7.8mm
Temperature Range	-10C to +60C	-20C to +60C
NVP	70%	76%
Dielectric Strength	2.5kV for 2s	2.5kV for 2s
Max. Pulling Load	60N	60N
Min. Bend (installation)	8x Cable OD	8x Cable OD
Min. Bend (installed)	4x Cable OD	4x Cable OD

Note: Technical properties of Copper F/UTP cable- 190-076 and S/FTP cable - 190-910 and 190-910-1000M are listed above. Technical properties for other part numbers are listed in the Annex section.

Standard	Subject
ISO/IEC 11801-1:2017	Information technology - Generic cabling for customer premises: Part 1 General Requirements
IEC 61156-5:2020	Multicore and symmetrical pair/quad cables for digital communications - Part 5: Symmetrical pair/quad cables with transmission characteristics up to 1 000 MHz - Horizontal floor wiring - Sectional specification
EN 50173-1:2018	Information technology. Generic cabling systems - General requirements
EN 50173-2:2018	Information technology. Generic cabling systems - Office premises
BS EN 50288-3-1:2013	Multi-element metallic cables used in analogue and digital communication and control. Sectional specification for unscreened cables characterised up to 250 MHz
EN 50399:2011+A1:2016	Common test methods for cables under fire conditions. Heat release and smoke production measurement on cables during flame spread test. Test apparatus, procedures, results
IEC 60332-1-2:2004 + A12:2020	Tests on electric and optical fibre cables under fire conditions. Test for vertical flame propagation for a single insulated
ANSI/TIA 568-D:2015	Balanced Twisted-Pair Telecommunications Cabling and Components Standards

IEC 60754-2:2014	Test on gases evolved during combustion of materials from cables - Part 2: Determination of acidity (by pH measurement) and conductivity
IEC 61034-2:2005+A2:2020	Measurement of smoke density of cables burning under defined conditions – Part 2: Test procedure and requirements
EN 50575:2014 + A1:2016	Power, control and communication cables — Cables for general applications in construction works subject to reaction to fire requirements
IEEE 802.3bt (Type 4)	Compliant to IEEE 802.3bt (Type 4)
RoHS	Compliant to the Restriction of Hazardous Substances
WFD	Compliant to Waste Framework Directive
SCIP	Compliant - Does Not Contain Substances of Concern in Products

Note: Technical Standards of all products assessed within this average EPD

Main Product Contents

Material/Chemical Input	%
Copper	40
Polyethylene	10
LSOH (Co-polymer)	40
Aluminium	10

Note: Material composition of all products assessed within this EPD

Manufacturing Process

The manufacturing process for these cables involves several stages of extrusion starting with the pure copper rod and finishing with the completed cable, which consists of multiple elements. The first process is to extrude pure copper rod through a series of precision dies, heated and pulled (extruded) to achieve the required gauge of the wire (23 AWG). This is a highly accurate process requiring that the wire diameter is continually monitored as it exits the extruder. The next stage is to apply the wire insulation which requires another extrusion process, where the wire is drawn through the extrusion machine whilst the molten plastic insulation is injected around the wire. The plastic insulation is colour coded, and this process is repeated 8 times to provide the 8 colours required for the final cable (blue, blue/white, orange, orange/white, green, green/white, brown, brown/white).

Each pair of wires then go to the next process which twists them together. 2 reels of insulated wire are spun and pulled simultaneously to provide a precise and consistent twist. Each pair is given a slightly different twist length. No 2 pairs are the same. This is critical for the performance of the finished cable.

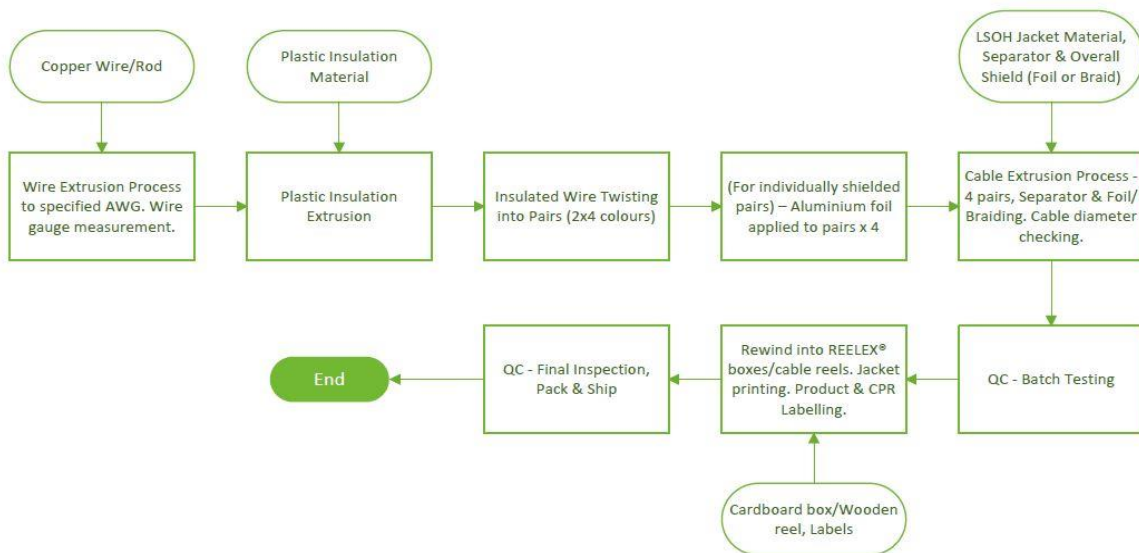

For cables where the pairs are individually screened with foil, there is a further extrusion process to apply the foil around each pair. This is repeated 4 times for all 4 pairs.

In the final process, all 4 pairs are again extruded into the final cable. This involves drawing the 4 pairs through the final extrusion process. The 4 pairs are drawn through a die together with a plastic separator, the LSOH cable jacket material (molten plastic), the overall foil or braid (where the foil is wrapped around the pairs and the braid is spun around the pairs) and any other elements that are used in the final cable design. As the cable exits the machine, it is passed through a water bath for cooling and its diameter is continuously measured.

The cable is reeled onto large reels initially and is finally re-reeled into REELEX® boxes or smaller wooden drums as required. The cable is tested to ensure compliance to the required standards. During the final boxing/reeing process, the cable is printed at 1m intervals with the cable details and batch details and the metre markings. Boxes/drums are also labelled with the cable and batch details, and also the CPR information.

Process flow diagram

CAT6 & CAT6A Shielded Cable

Construction Installation

Installation of data cables is generally carried out by manual labour, with teams of operatives pulling and dressing cables. No powered equipment or consumable items are used in this process, so no waste is generated during the installation. But there are some wastes at the end of the box, and it was assumed as 3% of the cables waste; they will be collected and sent to recycling.

End of Life

At the end-of-life the cables are removed manually. The cable will generally be collected by a registered broker for recycling and the process of separation takes place. Waste cables are shredded into small chips first and the metallic parts are separated from the plastics physically by using gravity and electrostatic separation techniques. The copper is recovered from other metallic elements by smelting and refining. This is used to make new cables. The plastics are also re-used for moulding into new plastic items. As a result of this experimental study, 97.2% of copper in waste cables is recovered and refined copper with 99.6 %Cu content is produced (Celik et al., 2019).

Life Cycle Assessment Calculation Rules

Declared unit description.

1 metre of Excel solid conductor CAT6 & CAT6A & CAT 7A shielded LSOH CPR Euroclass & UKCA compliant 4-pair Ethernet cables.

System boundary

This is a cradle-to-gate with options LCA, reporting all production life cycle stages of modules A1 to A3 and A4 and A5 (transportation and installation) and end of life stages C1-C4, and D in accordance with EN 15804:2012+A2:2019 and BRE 2021 Product Category Rules (PN 514 Rev 3.0).

Data sources, quality and allocation

The quantity used in the data collection for this EPD is the total quantity of CAT7A S/FTP manufactured as a proportion of the total manufactured during the data collection period (01/01/21-31/12/21) that was calculated at 0.68%. Mayflex receives the data cables from their manufacturing partners. Other cables and products are manufactured in addition to the CAT7A S/FTP cables; therefore, the allocation of electricity and water consumption and discharge are required, and this has been done according to the provisions of the BRE PCR PN514 and EN 15804. During the cable extrusion process no waste have been recorded.

Excel solid conductor are 4-pair ethernet cables and they are available in a range of colours and may have slightly differing mass per metre because the cables are in 305-metre REELEX® boxes or on 500m or 1000m reels which results in a change in the mass per metre. So, in this EPD the cable which has the highest mass per metre is taken as a representative among the group. The LCA analysis has been performed using 0.063 kg/m, which is for the CAT7A Cable S/FTP. Secondary data has been obtained for all other upstream and downstream processes that are beyond the control of the manufacturer (i.e., raw material production) from the ecoinvent 3.8 database. All ecoinvent datasets are complete within the context used and conform to the system boundary and the criteria for the exclusion of inputs and outputs, according to the requirements specified in EN15804 A2.

ISO14044 guidance. Quality Level	Geographical representativeness	Technical representativeness	Time representativeness
Very Good	Data from area under study.	Data from processes and products under study. Same state of technology applied as defined in goal and scope (i.e., identical technology).	n/a
Very Good	n/a	n/a	There is approximately 1-2 years between the Ecoinvent LCI reference year, and the time period for which the LCA was undertaken.

Specific European datasets have been selected from the ecoinvent LCI for this LCA. Manufacturer uses the national grid electricity for production, so therefore the national grid electricity dataset has been used for the LCA modelling (Ecoinvent 3.8). The quality level of time representativeness is also Very Good as the background LCI datasets are based on ecoinvent v3.8 which was compiled in 2021. Therefore, there is less than 5 years between the ecoinvent LCI reference year and the time period for which the LCA was undertaken.

Cut-off criteria

All raw materials and energy input to the manufacturing process have been included, except for direct emissions to air, water, and soil, which are not measured. The inventory process in this LCA includes all data related to raw material, packaging material and consumable items. Process energy, water use, and discharge are included, except the production waste and non-production waste.

LCA Results - 0.063 kg/m of Excel Solid Cat6A Cable U/FTP LSOH CPR Euroclass B2ca 305m

MER = Materials for energy recovery;
EE = Exported Energy

Scenarios and additional technical information

Scenarios and additional technical information			
Scenario	Parameter	Units	Results
A4 – Transport to the building site	Mayflex receives the cable from PRC and without any further processing in the distribution sector they will be distributed to the customer site.		
	Fuel type / Vehicle type	Road transport	16–32-ton lorry
	Distance: Mayflex to customer site	Km	172
	Capacity utilisation (incl. empty returns)	%	49
	Bulk density of transported products	kg/m ³	342
A5 – Installation in the building	Installation of data cables is carried out by manual labour - teams of operatives pulling and dressing cables. No powered equipment or consumable items are used in this process, so no waste is generated during the installation. But there are some wastes at the end of the box, and it was assumed as 3% of the cables waste; this will be collected and sent to recycling.		
Cable wastes	Cable offcuts – Copper and plastic insulation	Incinerated	0.002kg
Packaging	Wooden Pallets	Incinerated	0.0038 kg
	Cable drums	Incinerated	0.01 kg
End of life	Cables are removed manually from the building sites. Therefore, no energy is associated while removing the cables from the building.		
C2 – Transportation	Recovered cables are taken back by the registered broker	Road transport	16–32-ton lorry
	Distance: Deconstruction unit to pre-processing unit	km	12.5
C3 – Pre processing	Cat6A Cable FTP cables are made of copper, polymer, polyethylene, and other materials. At the end-of-life, cables are removed manually from the building sites, and they will be sent to pre-processing unit. At the pre-processing unit, waste cables are shredded first to decrease their size and the metallic parts are separated from plastics physically by using gravity and electrostatic separation techniques. The copper is recovered from other metallic elements by smelting and refining. The shredding and separation, and smelting processes have not been included in module C3 because it is assumed to be very small and are effectively negligible. (Celik et al., 2019).		
	Recovered cable to recycling	%	97.2
C4 - Disposal	The recovered cable is sent recycling while a small portion is assumed to be unrecoverable which is considered to send to landfill.		
	Unrecoverable cable to landfill	%	2.8
Module D	It is assumed that 97.2% of the cable used in the construction building is recovered for recycling and remaining 2.8% is sent to landfill. The calculation assumes that there is no yield-loss during the recycling process. Recycling (97.2%): 0.0612 kg/m. Landfill (2.8%): 0.0018 kg/m.		
	Copper – Recycled	kg/m	0.0242
	Polyethylene – Recycled	kg/m	0.0061
	Aluminium – Recycled	kg/m	0.0058
	Co-Polymer – Recycled	kg/m	0.0251

Interpretation of results:

The bulk of the environmental impacts are attributed to the manufacturing of Cat6A FTP cables covered by information modules A1-A3 of EN15804:2012+A2:2019.
