### Manufacturing site(s)

Duco Ventilation & Sun Control Bedrijvenlaan 2, 8630 Veurne, Belgium

### **Construction Product:**

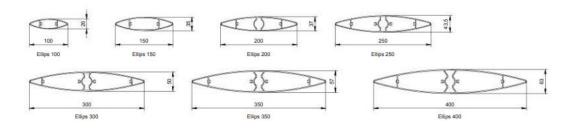

#### **Product Description**

The DucoSun Ellips is available with fixed or with electronically adjustable louvre blades. In the scope of the EPD only the fixed range is included. These are installed on site in the support structure (horizontal or vertical). Here, many different angles are possible. This enables the system to provide the optimum shade, irrespective of the glass surface area and irrespective of where the sun is coming from.

The eliptical louvre blades ensure the maximum amount of diffuse daylight. They are available in seven formats: 100 - 150 - 200 - 250 - 300 - 350 - 400.

### **Technical Information**

Shading studies can be done, but they are always project-based. An specific system on an east façade in London will give different results from the same slat on a south façade in South of France.

### **Main Product Contents**

hre

Material/Chemical Input	%
Aluminium (75% recycled content)	+/- 97%
Powder coating	+/- 3%

#### **Manufacturing Process**

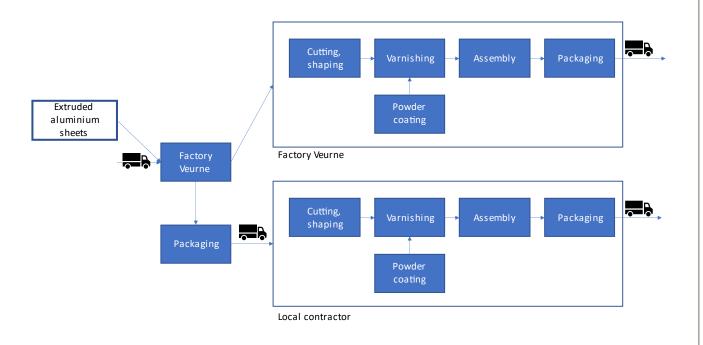

Raw materials such as extruded aluminium sheets, plastic and steel components are delivered at the factory in Veurne, Belgium. At this point two possible manufacturing routes exist. The components are either processed into the final product at the factory in Veurne or they are further shipped to a local subcontractor in the country of installation, who will process the components into the final product according to DUCO's design and specifications. The processing of the components consists of cutting and forming to correct size and shape, varnishing the aluminium with a powder coating, assembly of the product and packed for transportation. The assembly is depending on the product sometimes performed directly at the installation site.

Note that in the reference model the manufacturing impact is based on the inputs/outputs used in the headquarters in Veurne, Belgium. It is important to consider that the type of operations at the local subcontractors are the same as in DUCO Veurne. Therefore, it can be assumed that the main difference is the electricity mix used. The variability between the electricity mix in Veurne and the UK has been described in the section 'Variability study'.

EPD Number: 000560	
BF1805-C-ECOP Rev 0.3	

Date of Issue:04 March 2024 Page 4 of 18

### **Process flow diagram**

### **Construction Installation**

The distance between Veurne (Belgium) and Manchester (UK) has been used as a representative distance between Veurne and the UK

The following scenario was adopted: use of an articulating boom at a speed of installation of 10 m<sup>2</sup>/hour. The electricity consumption is assumed to be 15.12 kWh/hour, based on the technical specifications of articulating boom 'GENIE Z-34/22N' (48 V, 315 Ah).

This product is attached with aluminium side plates to the customer's supporting structure. The customer's structure can be very different (steel, wood, directly on building façade, combination with walkway), therefore it has been excluded from the scope of the EPD.

#### **Use Information**

No emissions arise during the use phase, no maintenance/repair is required under normal conditions of use.

### End of Life

The aluminium and steel are 95% recycled and 5% landfilled.

### Life Cycle Assessment Calculation Rules

#### **Declared / Functional unit description**

1 m2 of installed sun shading system based on a reference system of 6x6 m.

The weight per reference flow of the representative product is 10 kg.

#### System boundary

This is a cradle-to-grave EPD

#### Data sources, quality and allocation

#### Information on data collection

Manufacturer specific data have been collected for the year 2021.

Company specific data for the production at the factory in Veurne has been collected by Duco and were provided to Enperas through an excel file. The LCI data has been checked by the EPD verifier (Pat Hermon. Enperas uses publicly available generic data for all background processes such as the production of electricity, transportation by means of a specific truck, etc. Primary data is used for modules A1, A2, A3 and A5. The rest of the study is based on scenarios (modules A4, C1-C4, and module D).

#### Software

For the calculation of the LCA results, the software program SimaPro 9.3.0.3 (PRé Consultants, 2021) has been used in combination with a specific LCA software program for Duco. This specific LCA tool has been verified by BRE.

#### Data sources

Ecoinvent 3.8 and Industry 2.0

Electricity from the grid: Electricity, medium voltage {BE}| market for | Cut-off, U Electricity from own solar panels: Electricity, low voltage {BE}| electricity production, photovoltaic, 3kWp slanted-roof installation, single-Si, panel, mounted | Cut-off, U

Aluminium (main impact): recycled content of 75%. For the 25% primary material the European average 'market for' (i.e. including import from outside Europe) datarecord has been used.

#### Information on allocation

For processes, where allocation is necessary (multiple input or output processes), the allocation procedure described by the European standard EN 15804+A2 has been followed. Furthermore, joint co-production, where the processes cannot be divided, as well as allocation of secondary materials or secondary fuels is not applicable in this study.

- No co-products are produced.
- Allocation of factory data: at DUCO, different products are produced. For the baseline products only facility level data were available for the energy consumption (i.e. electricity, natural gas, diesel ...), water use and ancillary materials. The facility level data have been allocated to 1 kg of product by dividing the factory data by the total production volume (approximated by total purchased aluminium). The percentage of production at local subcontractors has also been considered in this calculation.

### **Cut-off criteria**

The following processes are considered below cut-off:

- Ancillary materials at production site
- General waste at production site. Only aluminium waste has been considered, as this is the main waste flow and general waste stream also contains waste from offices, sanitary facilities etc ...
- Environmental impacts caused by the personnel of the production plants are not included in the LCA, e.g. waste from the cafeteria and sanitary installations, accidental pollution caused by human mistakes, or environmental effects caused by commuter traffic. Heating or cooling of the plants to ensure a comfortable indoor climate for the personnel for example is also neglected.

### Scenarios and additional technical information

Scenario	Parameter	Units	Results					
	The distance between Veurne (Belgium) and Manchester (L representative distance between Veurne and the UK	IK) has been used a	as a					
	Fuel type / Vehicle type	liter of diesel/km	0.254					
A4 – Transport to the building site	Distance	km	600					
	Capacity utilisation (incl. empty returns)	%	Ecoinvent					
	Bulk density of transported products	kg/m <sup>3</sup>	2710 (density aluminium)					
	The following scenario was adopted: use of an articulating b m²/hour. The electricity consumption is assumed to be 15.1 specifications of articulating boom 'GENIE Z-34/22N' (48 V,	2 kWh/hour, based	on the technica					
A5 – Installation in the building	The dimensions of the products are made to measure at the manufacturer, and therefore the installation losses are very limited. As a conservative approach and to account for some unexpected losses a percentage of 1% has been declared.							
	This product is attached with aluminium side plates to the customer's supporting structure. The customer's structure can be very different (steel, wood, directly on building façade, combination with walkway), therefore it has been excluded from the scope of the EPD.							
Reference service life	50 years							
B use phase	No emissions arise during the use phase No maintenance/repair/refurbishment required under norma No operational water/energy use.	l conditions of use						
	<ul> <li>The following end-of-life scenario has been assumed:</li> <li>Aluminium and steel components: 95% recycling a</li> </ul>	nd 5% landfill						
C1 to C4 End of life,	<ul> <li>For the transport to the waste treatment facilities the followir</li> <li>From the installation site to the sorting facility: 30 k</li> <li>From the sorting facility to landfill: 50 km</li> <li>From the sorting facility to incineration: 150 km</li> <li>From the sorting facility to recycling: 200 km</li> <li>In all cases a 16-32 Truck EURO6 is used</li> </ul>		en assumed:					
Module D	<ul> <li>Recycling of aluminium components</li> <li>Loads after end-of-waste state: remelting of alumin</li> <li>Benefits: avoided impact of virgin aluminium alloy</li> <li>The net amount of scrap is considered. Note that t aluminium used to produce the product under study subtracting this from the recycled amount and end-</li> </ul>	he recycled conten y (75%) is consider	t of the					
	Energy recovery and benefits from recycling of packaging m are less significant	aterials are also co	nsidered, but					

### Variability study

To prove the representativeness of **DucoSun Ellips 200/45**° for the other products included in the scope of the EPD a variability was performed. The analysis shows that the variability is less than -15% and +35%, and thus DucoGrille Classic 50Z is representative for the products DucoSun Ellips 100/45°, **DucoSun Ellips 150/45**° ( $\rightarrow$  MIN variation -20%), DucoSun Ellips 200/45°, DucoSun Ellips 250/45°, DucoSun Ellips 300/45°, DucoSun Ellips 350/45°, **DucoSun Ellips 400/45**° ( $\rightarrow$  MAX variation +30%).

The table below shows an overview of the amount of aluminium components per declared unit for the different products. Note that the amount of aluminium is the most important factor influencing the environmental impact of the product. The variability study showed that the variation in the environmental impact is proportional to the variation in the aluminum content.

Product name	Relative weight of aluminium components compared to the reference product (in %)
DucoSun Ellips 100/45°	83%
DucoSun Ellips 150/45°	81%
DucoSun Ellips 200/45°	100% → reference
DucoSun Ellips 150/45°	106%
DucoSun Ellips 300/45°	115%
DucoSun Ellips 350/45°	121%
DucoSun Ellips 400/45°	126%

	DucoSun Ellips 150/45° (MIN variation)	DucoSun Ellips 400/45° (MAX variation)
15804+A2-Climate change	84%	126%
15804+A2-Ozone depletion	83%	126%
15804+A2-Ionising radiation	85%	124%
15804+A2-Photochemical ozone formation	83%	126%
15804+A2-Particulate matter	83%	126%
15804+A2-Human toxicity, non-cancer	83%	126%
15804+A2-Human toxicity, cancer	83%	127%
15804+A2-Acidification	83%	126%
15804+A2-Eutrophication, freshwater	83%	127%
15804+A2-Eutrophication, marine	83%	126%
15804+A2-Eutrophication, terrestrial	83%	126%
15804+A2-Ecotoxicity, freshwater	83%	126%
15804+A2-Land use	83%	126%
15804+A2-Water use	83%	127%

#### **Production at local factories**

The products are processed from aluminium sheets to final products at DUCO, Veurne (Belgium), or the sheets are shipped to a local subcontractor at the location of installation (i.e. UK) where it is further processes. Note that in the reference model the manufacturing impact at local subcontractors is extrapolated based on the inputs/outputs used in the headquarters in Veurne, Belgium. In other words, it is assumed that the local factories have the same impact per declared

unit. It should be noted that the type of operations at the local subcontractors are the same as in DUCO Veurne, therefore it can be assumed that mainly the difference in electricity mix used will cause the variability.

A variability study from cradle-to-grave (Module A1-C4) between the reference product using 100% electricity mix at the factory in Veurne and a product using 100% UK electricity mix, has been performed in the LCA background report. This exercise showed that the variance is <5%, if the local subcontractors use the same production process and thus same energy consumption as at the production site in Veurne, Belgium.

### Interpretation of the results

This EPD shows the environmental profile of 1 m2 of DucoSun Ellips sun shading system with fixed slats based on a reference system of 6x6 m. The EPD contains multiple products for which DucoSun Ellips 200/45° is used as representative product.

The environmental profile shows that the raw materials have the highest contribution on most impact categories followed by the production process. The other life cycle stages are less significant.

When looking at the raw materials the production of aluminium contributes more than 80% to the environmental impact. During the production process, energy consumption is most relevant.

Outside the system's boundaries, module D shows benefits from the recycling of aluminium, recycling of steel and energy recovery from plastic components. Also recycling and energy recovery of packaging is included in module D but is not significant. As aluminium is the main component of the product, the main benefit in module D comes from recycling of aluminium. Note that to calculate the benefits from recycling in module D the recycled content of the aluminium (75%) used to produce the product under study has been considered by subtracting this from the recycled amount and end-of-life.
