

Statement of Verification

BREG EN EPD No.: 000301

Issue 01

This is to verify that the
Environmental Product Declaration
provided by:
SAS International

is in accordance with the requirements of:
EN 15804:2012+A1:2013
and
BRE Global Scheme Document SD207

This declaration is for:
SAS System 330 (Steel)

Company Address

31 Sutton Business Park
Reading
UK
RG6 1AZ

A handwritten signature in black ink, appearing to read 'E Baker'.

Signed for BRE Global Ltd

Construction Product:

Product Description

SAS 330 system forms part of our premium offering with a host of value-added design elements.

A profile suspended ceiling, the system is available in a tartan or linear grid form, suitable for any building module. Ceiling tiles can be of any shape, in up to 3m lengths and available in a variety of finishes. The design flexibility of SAS 330 allows for complete void access, total service integration and offers lighting integration. Signage and partitioning can be seamlessly integrated via the M6 threaded Omega C-Profile. Alternatively, we offer a flush, plain C-Profile for a clean, purist aesthetic. Either profile has the option of a gasket to aid precision, uniform installation.

Module Sizes: SAS330 ceiling tiles can be manufactured in mm increments up to 3m lengths. The specifier should note that maximum panel sizes are limited by industry tolerance guidelines.

Technical Information

Property

System components are manufactured and tested in accordance with BS EN 13964:2014 including essential characteristics performance:

Reaction to Fire: (up to) A2-S1-D0 European Reaction to Fire classification system (Euroclasses)

Release of Formaldehyde: CLASS E1

Release of Asbestos: NO CONTENT

Sound Absorption: (up to) Single Value $\alpha_w = 1.00$ class A

Durability: CLASS B

Main Product Contents

The raw material quantities have been taken for all variations of the system and modelled as a single dataset. The main product contents listed below represent the average values derived from this dataset, with a weight of 7.242Kg/m²

Material/Chemical Input	%
Steel	99%
Polyester Powder Coating	1%

Manufacturing Process

The Bridgend factory is split into two separate units; Unit 1 is where the tile and linear systems are formed, including the addition of the various types of acoustic padding. Key Unit 1 processes include: slitting of the steel/aluminum coils, cutting and perforating, washing, spray coating and drying. These processes account for the most energy intensive stages of the products life cycle. Unit 2 is where the grid systems are rolled and formed; it houses less energy-intensive processes than Unit 1.

The recycled content of steel used in with the systems vary from 20% to 25% subject to availability of recycled materials within the global market at time of purchase. The average recycled content can further be broken down into 18% pre-consumer and 6% post-consumer scrap metals.

Process flow diagram

SAS Ceiling Steel Tile Manufacturing Process

Life Cycle Assessment Calculation Rules

Declared / Functional unit description

1m2 SAS 330 SYSTEM (7.242Kg/m2) Polyester powder coated steel tile including suspension grid and brackets for use in ceiling applications.

System boundary

This is a cradle-to-gate with options LCA, reporting all production life cycle stages of modules A1 to A3, and C3 waste processing and end of life disposal module C4 in accordance with EN15804:2012+A1:2013.

Data sources, quality and allocation

This is a cradle-to-gate with options LCA, reporting all production life cycle stages of modules A1 to A3, and end of life disposal module C4 in accordance with EN 15804:2012+A1:2013. No inputs or outputs have been excluded and all raw materials, packaging and transport, energy, water use and wastes, are included, except for direct emissions to air, water and soil, which are not measured. Upstream extraction and/or processing of inputs are included within the use of the background datasets within LINA.

Raw material quantities have been taken from recorded production/manufacture data and product geometry from the Syteline internal production system, for all variations of the SAS 330 systems made in the 12-month period. Due to the various sizes of System 330 product produced within the period, the raw materials used have been calculated by total weight (KG) in production divided each by total production in M2. Additionally, the calculation includes for carrier rail and brackets, applied to M2 application.

SAS International manufacture other products in addition to the System 330 so some allocation of primary data has been carried out. Since the manufacturing steps responsible for washing, powder coating, drying, cutting and mitring, holes and apertures routed out are the most energy intensive processes of the site, it is assumed that the gas and electricity consumption is the same for every m2 of metal product produced. This same allocation was applied to total site water usage. Production waste has been allocated to individual products by applying a percentage wastage rate (based on historical values and used for stock management) to each quantity of raw material. All packaging and non-production waste (waste packaging) has also been allocated using this methodology with applied percentage based on planned/estimated packaging and waste requirements for each products/systems/component.

Secondary data has been drawn from the BRE LINA database v2.0.29 and the background LCI datasets are based on ecoinvent v3.2. Upstream extraction and/or processing of inputs are included within the use of the background datasets within LINA. Emissions from fuels used are included within the relevant datasets.

Cut-off criteria

No inputs or outputs have been excluded and all raw materials, packaging and transport, energy, water use and wastes, are included, except for direct emissions to air, water and soil, which are not measured.

LCA Results

MFR = Materials for recycling

MER = Materials for energy recovery;
EE = Exported Energy

Scenarios and additional technical information

Scenarios and additional technical information			
Scenario	Parameter	Units	Results
C3 Waste Processing	System 330 is steel composition and it is assumed that at 'End of Life' or service the product and associated metal components can be dismantled and sorted into the various waste/recycling routes. As part of dismantling the system and sorting process, powder coated finished materials do not need to be removed from components and will be managed via existing industry recycling routes/methods.		
C4 End of life	It is assumed that as the main element of the System 330 is steel and is valuable material, 100% of the product is recycled at end of life. Powder coat finish will remain and be processed as part of the steel recycling process.		

Summary, comments and additional information

Explanation of non-entries

Each SAS system is developed as a finished product, ready for installation without further preparation or finishes, the amount of packaging (manufacture of which has been included in Module A3) is a significant part of the overall mass of each m2 to provide suitable protection to the products during transport and storage. Module A4 and A5 have not been modelled within the LCA, however the following breakdown of product and packaging can be applied to each m2 of system 330.

Product: 89%
 Softwood - 3.8%
 Plywood - 1.5%
 OSB - 3.2%
 Cardboard - 1.6%
 Paper - 0.21%
 Plastic firm wrapping - 0.21%
 Plastic strapping - 0.21%

No emissions to air, water and soil have been included in A3 as they are not required to be measured on site by local/national enforcement agencies as any emissions are below reportable levels. SAS carries out annual inspection and testing of curing ovens and effluent wastewater as part of internal environmental management system and ISO 14001 record management process. Emissions from fuels used are included within the relevant datasets.

No ancillary materials are required in association with the production of the system and therefore not included within the LCA
