### **Statement of Verification**

BREG EN EPD No.: 000442

Issue 01

This is to verify that the

**Environmental Product Declaration** provided by: **PPG Architectural coatings** 

is in accordance with the requirements of:

EN 15804:2012+A2:2019

and

BRE Global Scheme Document SD207

This declaration is for: Johnstone's Tade Quick Drying Steel & Cladding Topcoat

#### Manufacturing site(s)

7 All. de la Plaine, 76700 Gonfreville-l'Orcher, France

#### **Construction Product:**

#### **Product Description**

A quick drying water based anti-corrosive topcoat for ferrous metal and cladding. It is typically applied with standard roller application on exterior metal, using two layers of the product. One EPD is produced per product group. In order to group different paints belonging to the same product type within the EPDs, a representative paint product is constructed. Annual sales volumes are used to construct the weighted average representative paint. Sales volumes are based on the year averaged values for the year 2021.

The average calculation rule is applied to paint composition and performance characteristics (e.g. formulation, density, coverage), as well as the coatings production sites characteristics including the production inputs (electricity, natural gas, coal and water) and outputs (hazardous and non-hazardous waste, and wastewater outputs).

#### **Main Product Contents**

| Material/Chemical Input | %           |
|-------------------------|-------------|
| Binder                  | 20 - 25     |
| Water                   | 32.5 - 42.5 |
| Solvent                 | 0 - 0.1     |
| Additives               | 3 - 4       |
| Biocide                 | 0 - 1       |
| Filler                  | 7.5 - 27.5  |
| Glycol and ester        | 5 - 10      |
| Pigment                 | 0 - 25      |

#### **Manufacturing Process**

The manufacturing process involves the mixing and dispersing of raw materials into a homogeneous mixture. The product is then packaged for distribution to the customer.

#### **Process flow diagram**

#### **Construction Installation**

All surfaces should be sound, clean, dry and free from grease. Remove any crazed or flaking paint. Stir well before use and apply by brush, roller or paint pad. When using a roller, use a medium pile synthetic type. Apply liberally and evenly; avoid overspreading. Do not apply when air or surface temperature is less than 10°C or in damp conditions. If more than one can of colour is to be used in the same area, intermix before use.

#### End of Life

The end-of-life stage (module C) of paints is reached when the paint products are discarded with the surface they are applied on; thus, the paint is normally not separated from that surface during the disposal process. The end of life of the product is that of the underlying substrate. After its disposal, it is assumed that the dried paint film ends up entirely in landfill, in line with the PEFCR for decorative paints (v1.). Therefore, landfilling is the 100% scenario included in this EPD.

| EPD Number: 000442    | Date of Issue:22 September 2022 | Expiry Date 21 September 2027 |
|-----------------------|---------------------------------|-------------------------------|
| BF1805-C-ECOP Rev 0.2 | Page 5 of 16                    | © BRE Global Ltd, 2022        |

Benefits and loads beyond the product system boundary are reported as additional information in module D. The module declares net benefits and loads from net flows leaving the product system that have passed the end-of-waste state, except those which have been allocated as co-products. Net impacts in module D are calculated according to Annex D of EN15804+A2.

### Life Cycle Assessment Calculation Rules

#### **Declared / Functional unit description**

Protecting and decorating 1m<sup>2</sup> of substrate, suitably prepared, on the basis of two layers of the product, a spreading rate of 11 m2/L and a weight of 0.245 kg/m2. These characteristics apply for the paint application on exterior metal.

#### System boundary

The system boundaries of the product LCA follow the modular design defined by EN15804+A2. This cradle-to-gate with options study includes the Product stage (A1-A3), Transport stage (A4), Installation stage (A5), Deconstruction (C1), End-of-life transport (C2), Waste processing (C3), Disposal (C4) and Reuse, recovery and/or recycling potential (D).

#### Data sources, quality and allocation

Data related to in-house PPG processes has been collected from PPG reporting systems and is of high quality. The data collection period is the full year of 2019.

For life cycle modelling of the process, Sphera Gabi 10.5.1.124 software (2021 version) is used. All relevant background datasets are taken from Ecoinvent 3.7.1 (September 2020 version) and Raw materials LCI database for the European coatings and printing ink industries (CEPE, 2016) and are consistent with the foreground modelling in system limits and allocation procedures.

Electricity used in each manufacturing location is assumed to be 100% from local residual mix (2020 European Residual Mix)

The technological and geographical coverage reflects the physical reality as far as possible taking into account the technology mix, location, and representativeness of technologies, input materials, and input energies for the region.

#### **Cut-off criteria**

No cut-offs were intentionally applied to inputs and outputs within the system boundaries in the models. Cut-offs in the background processes are according to the respective methodologies.

#### Summary, comments and additional information

#### Interpretation

The results of the LCIA indicate which life cycle stage contributes the most to a specific environmental impact.

Analysis of the results shows that most of the impact comes from the raw materials stage (A1) for most of the impact categories. This high contribution of raw materials to the impact indicators is not unexpected. As paints are at the end of the chemical value chain much of the expenditure of energy, raw materials, processing, waste processing, etc. in bringing the product to existence has occurred prior to the entry of the raw materials onto the PPG production site.

In impact category Photochemical ozone formation, human health the highest impact occurs in stage application (A5). This can be caused by the direct VOC emissions.
