Statement of Verification

BREG EN EPD No.: 000719 Issue 01

This is to verify that the

Environmental Product Declaration

provided by:

GCP Applied Technologies

BRE Global Verified EPD

is in accordance with the requirements of:

EN 15804:2012+A2:2019

and

BRE Global Scheme Document SD207

This declaration is for:

1m2 of Bituthene® 8000/8000S waterproofing membrane products installed over a 100-year period.

Declared/Functional Unit	**Applicability/Coverage**
1m^2 of Bituthene® 8000/8000S waterproofing membrane products installed over a 100-year period.	Product Average.
EPD Type	**Background database**
Cradle to Grave	Ecoinvent 3.8

Demonstration of Verification
CEN standard EN 15804 serves as the core PCR [a]
Independent verification of the declaration and data according to EN ISO 14025:2010 ☐Internal ☒ External
(Where appropriate [b])Third party verifier: Francis Yu
a: Product category rules b: Optional for business-to-business communication; mandatory for business-to-consumer communication (see EN ISO 14025:2010, 9.4)

Comparability
Environmental product declarations from different programmes may not be comparable if not compliant with EN 15804:2012+A2:2019. Comparability is further dependent on the specific product category rules, system boundaries and allocations, and background data sources. See Clause 5.3 of EN 15804:2012+A2:2019 for further guidance

Construction Product:

Product Description

GCP Applied Technologies (“GCP”) BITUTHENE® 8000/8000S membranes combine the proven BITUTHENE® adhesive technology with a unique, grey coloured carrier film to provide superior performance and easier installation. BITUTHENE® 8000/8000S membranes are extremely tough. Accidental damage which would otherwise be missed, is made more visible by the black compound showing through the light grey film. It is an advanced, self-adhesive membrane with unique HDPE composite film that provides superior physical properties for water and vapour proof application in sub-structures.

This EPD covers the products Bituthene® 8000/8000S waterproofing membranes. The results are based on a production-weighted average, as all products share a similar composition and are manufactured using the same process.

Technical Information

Property	Value, Unit
Visible defects (EN1850-2)	None
Straightness (EN1848-2)	Pass
Length (EN1848-2)	20.15 m ± 0.15
Thickness (EN1849-2)	1.52 mm ± 0.08
Width Carrier Sheet (EN1848-2)	0.987 mm ± 0.007
Width Overall (roll) (EN1848-2)	1.000 m ± 0.005
Mass per unit area net of release paper (EN1849-2)	1.55 kg/m^2 ± 90 max
Water tightness to liquid water (at 60 kPa) (EN1928)	Pass
Resistance to impact (Al board) (EN12691)	≥ 150 mm

Property	Value, Unit
Resistance to tearing (Nail Shank)- unreinforced sheets (EN12310-1)	≥ 100 N
Joint strength (EN12317-2)	≥ 190 N/50mm
Water vapour transmission (EN1931)	105.000 μ (= sD/d) ± 30%
Durability of water tightness against ageing/degradation (at 60 kPa) (EN1296 / EN1928 Method B)	Pass
Durability of water tightness against chemicals (at 60 kPa) (EN 1847 Method B / EN 1928 Method B)	Pass
Durability of tensile properties against chemicals (EN13967 Annex C)	Pass
Compatibility with bitumen (EN1548)	Pass
Resistance to static loading (EN12730)	≥ 20 - Pass
Tensile properties – unreinforced sheets (EN 12311-2 Method A)	Longitudinal ≥ 180 N/50mm Transversal ≥ 180 N/50mm
Tensile properties – unreinforced sheets - elongation (%) (EN 12311-2 Method A)	Longitudinal ≥ 5% Transversal ≥ 5%
Reaction to fire (Class; test conditions) (EN 13501-1)	E

For more information please visit BITUTHENE 8000_8000S.pdf or please contact the GCP technical team.

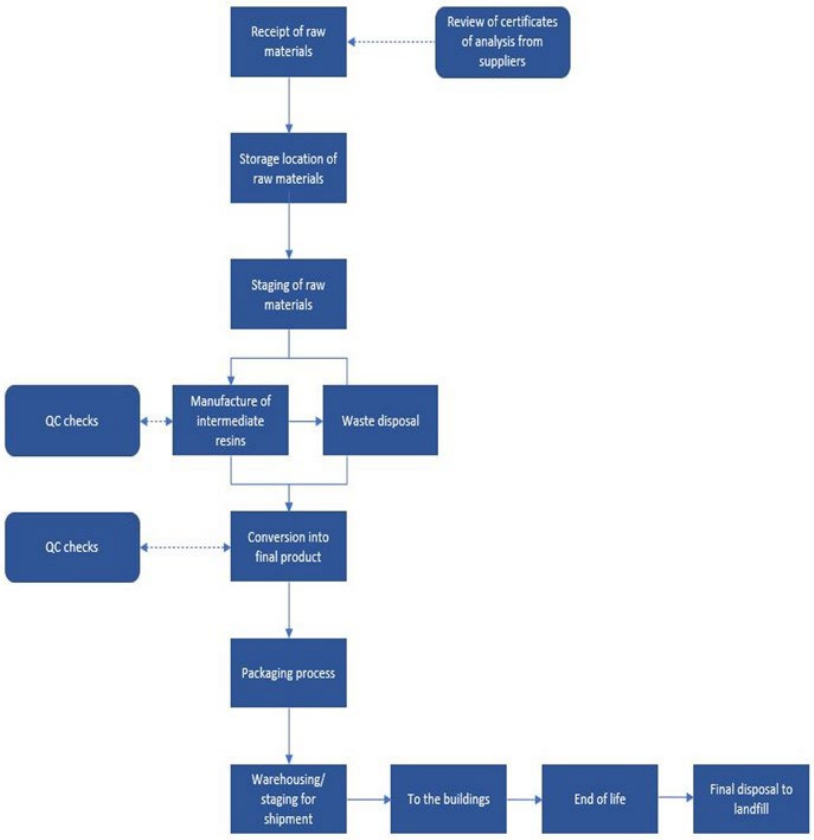
Main Product Contents

Bituthene® 8000/8000S Material/Chemical Input	%
Bitumen	35-45
Rubber	10-20
Petroleum Distillate	20-30
Paper	5-10
HDPE and other	5-10

Manufacturing Process

Heated adhesive is coated onto a release liner. A film is laminated, and the product is cut to length, rolled, and boxed for shipment.

Process flow diagram



Construction Installation

Prior to beginning application of Bituthene® membranes, all surfaces must be inspected to assure that they are free of frost, or condensation. Internal and external corners, penetrations and other “special” areas need to be fully detailed in accordance with GCP drawings and specifications with Bituthene® S2 primer in advance of placement of Bituthene® membranes. After completion of the surface preparation and detailing, Bituthene® membranes shall be laid by peeling back the protective release paper and applying the adhesive face onto the prepared surface.

Adjacent rolls are aligned using printed lines and overlapped 50 mm minimum at side and ends and well rolled with a firm pressure, using a lap roller to ensure complete adhesion and continuity between the layers. On high walls it may be necessary to batten fix the membrane to prevent slippage. Once the membrane is applied, cover with a protection board as soon as possible. On “green” concrete or damp surfaces, cover the membrane immediately.

Use Information

Bituthene® membrane is a flexible waterproof membrane combining a high performance cross laminated, HDPE carrier film with a unique super sticky self-adhesive rubber bitumen compound. The membrane, installed on the wall's surface, bonds with the structure, and protects it from the below ground water. If the Bituthene® system is properly and correctly installed as per GCP instructions, no maintenance, repair, or replacement is required during the service life of the structure. The highly durable, robust, and extremely reliable feature of the Bituthene® system will limit any repair work to a minimum, if membrane damage occurs. The fully bonded membrane will prevent any water migration and between membrane and the concrete structure in the event of puncturing or damaging the membrane. Thus, no scenario for repair work is defined.

End of Life

When a building is demolished at the end of its service life, the Bituthene® membrane system bonded to the concrete cannot be separated and remains part of the construction rubble. This is in general taken to landfill. Bituthene® membrane is only a minor part of the whole volume during demolition of the concrete structure. Therefore, no other steps are considered as necessary with the exception for a transportation to a landfill.
If the client and wrecking contractor are required according to local regulations to separate the demolished concrete from steel reinforcement and other embedded items, the Bituthene® will remain bonded to the concrete, which can be grinded to smaller concrete particles and used as backfilling material or substrate in other construction work.

Life Cycle Assessment Calculation Rules

Declared / Functional unit description.

1m^2 of Bituthene® 8000/8000S waterproofing membrane products installed over a 100-year period.

System boundary

This is a cradle-to-grave EPD with all options declared LCA of GCP's Bituthene® waterproofing membrane products, manufactured by GCP in the United States and distributed in the UK. It follows the modular design defined in EN 15804:2012+A2:2019 and BRE PCR EN 15804+A2 PN 514 Rev 3.1 which covers product stage impacts (A1 to A3), construction/installation (A4 to A5), Use stage (B1-B7) and End of life modules (C1-C4), and module D.

Data sources, quality and allocation

The LCA analysis has been conducted for 1 m² of Bituthene® 8000/8000S waterproofing membrane products, with a manufactured weight of 1.602 kg/m² based on the average production quantity. Therefore, the average results are included in this EPD.

Manufacturer-specific data from GCP covering a production period from 1st January to 31st July 2021 has been used for this EPD. Figures for input materials and packaging were uplifted to account for production waste. Only seven months of production data was used for the LCA modelling due to limited data availability and the manufacturer has confirmed that the manufacturing process and the electricity used for the manufacturing remains the same

GCP manufacture other products at the Mt. Pleasant site. Allocation by mass has been used to calculate the input energy flows (electricity and natural gas), packaging, ancillary, emissions to air and water and waste flows per selected products according to the provisions of the BRE PCR PN514 and EN 15804+A2. Product formulations including ancillary and packaging data were combined with allocated manufacturing data to calculate the cradle to gate LCA profiles for the Bituthene® 8000 products. Since both products Bituthene® 8000/8000S have the same weight per square metre, a production weighted average has been calculated for all entries. During the LCA modelling, some datasets were not available in ecoinvent 3.8; therefore, suitable proxy datasets were used.

Bituthene® 8000/8000S products form 0.93% of total production at the site. Upon checking the mass balance during the data entry, the raw material input quantities are less than the production output because the waste quantities is based on the estimation rather than actual measurement, therefore the uplift has been performed to the raw material input. The difference in weight between manufactured and installed weights is due to the release paper being removed during installation.

Secondary data has been obtained for all other upstream and downstream processes that are beyond the control of the manufacturer (i.e., raw material production) from the ecoinvent 3.8 database. All ecoinvent datasets are complete within the context used and conform to the system boundary and the criteria for the exclusion of inputs and outputs, according to the requirements specified in EN15804.

Quality Level	Geographical representativeness	Technical representativeness	Time representativeness
Very Good	Data from area under study.	Data from processes and products under study. Same state of technology applied as defined in goal and scope (i.e., identical technology).	There is approximately 1-2 years between the Ecoinvent LCI reference year, and the time period for which the LCA was undertaken.

Country specific datasets have been selected from the ecoinvent LCI for this LCA. Manufacturer uses the national grid electricity and natural gas for production; therefore, the national grid electricity and natural gas (RoW) dataset has been from Ecoinvent 3.8 for the LCA modelling. The GWP carbon footprint for using 1 kWh of Electricity – US consumption mix is 0.549 in kgCO2e/kWh and the GWP carbon footprint for using 1kWh of Natural gas (RoW) is 0.256 kgCO2e/kWh. The quality level of time representativeness is also Very Good as the background LCI datasets are based on ecoinvent v3.8 which was compiled in 2021. Therefore, there is less than 5 years between the ecoinvent LCI reference year and the time period for which the LCA was undertaken.

Cut-off criteria

No inputs or outputs have been excluded and all raw materials, packaging and transport, energy, water use, emissions to air and wastes, are included. Direct emissions to water and soil are not measured.

Scenarios and additional technical information

Scenarios and additional technical information			
Scenario	Parameter	Units	Results
A4 – Transport to the building site	Distances from US plant to UK distribution		
	Diesel/ 16-32 t lorry	Kg/km	0.3
	Distance:	km	1012.3
	Capacity utilisation (incl. empty returns)	%	24
	Ship distance by sea	Km	6614.4
	Ship capacity utilisation (incl. empty returns)	%	65
	Weight of transported products	Kg per roll	36
A5 – Installation in the building	Prior to beginning application of Bituthene® membranes, all surfaces must be inspected to assure that they are free of frost, or condensation. Internal and external corners, penetrations and other "special" areas need to be fully detailed in accordance with GCP drawings and specifications with Bituthene® LM (E) in advance of placement of Bituthene® membranes. After completion of the surface preparation and detailing, Bituthene® membranes shall be laid by peeling back the protective release paper and applying the adhesive face onto the prepared surface. Adjacent rolls are aligned using printed lines and overlapped 50 mm minimum at side and ends and well rolled with a firm pressure, using a lap roller to ensure complete adhesion and continuity between the layers. On high walls it may be necessary to batten fix the membrane to prevent slippage. Once the membrane is applied, cover with a protection board as soon as possible. On "green" concrete or damp surfaces, cover the membrane immediately. The protective film of the membrane sheets the average consumption of membrane per 1m2 is approx. plus 9% and Cutting waste and loss of material, between 1 - 2.5%, depending on geometry of building structure and necessary detailing. For this analysis, the cutting waste of 2.5% has been taken as a representative. Installation work shall be carried out only by GCP trained applicators/contractors. For further details refer to data sheets on https://gcpat.com/en/solutions/products/preprufe-membrane-pre-applied-waterproofing-solutions		
	Bituthene® Primer S2	kg	0.26
	Transport of Bituthene® Primer S2 to installation	km	1480
	Transport to installation: Diesel/ 16-32 t lorry	kg/km	0.3
	Capacity utilisation (incl. empty returns)	%	26
	Bituthene® waterproofing membrane waste at installation	%	2.5
	Transport of installation waste to landfill: Diesel/ 16-32 t lorry	kg/km	0.3
	Distance	km	7
	Capacity utilisation (incl. empty returns)	%	24

Scenarios and additional technical information			
Scenario	Parameter	Units	Results
B1 - Use B2 – Maintenance B3 – Repair B4 – Replacement B5 – Refurbishment	Bituthene® membrane is a flexible waterproof membrane combining a high performance cross laminated, HDPE carrier film with a unique super sticky self-adhesive rubber bitumen compound. The membrane, installed on the wall's surface, bonds with the structure, and protects it from the below ground water. If the Bituthene® system is properly and correctly installed as per GCP instructions, no maintenance, repair, or replacement is required during the service life of the structure. The highly durable, robust, and extremely reliable feature of the Bituthene® system will limit any repair work to a minimum, if membrane damage occurs. The fully bonded membrane will prevent any water migration and between membrane and the concrete structure in the event of puncturing or damaging the membrane. Thus, no scenario for repair work is defined.		
Reference service life	According to the BBA Agrement Certificate 97/3325 the service life for the Bituthene® system is stated for the lifetime of the structure. Bituthene® is based on a highly durable HDPE carrier film with lifetime expectations > 100 years in service. Therefore, at least a 100-year building service life can be assumed.		
C1 - Deconstruction	When a building is demolished at the end of its service life, the Bituthene® membrane system bonded to the concrete cannot be separated and remains part of the construction rubble. This is in general taken to landfill. Bituthene® membrane is only a minor part of the whole volume during demolition of the concrete structure. Therefore, no other steps are considered as necessary with the exception for a transportation to a landfill. Distance assumed is to a middle-sized landfill in South London and from the location of installations in the centre of London. It's assumed as 100% of the product is recovered at the demolition site.		
C2- Transportation	Distance assumed is to a middle-sized landfill in South London from the location of installations in the centre of London.		
	Diesel/ 16-32 t lorry	kg/km	0.3
	Distance	km	7
	Capacity utilisation (incl. empty returns)	%	26
	Weight of transported products to landfill	kg/m^2	1.602
C3 – Waste processing	The worst-case end of life scenario has been assumed i.e., 100% of the product waste will be landfilled at the end of life without any pre-processing. Therefore, no impacts on C3 and module D benefits.		
C4 – Disposal	Weight of transported products to landfill	kg/m^2	1.602
C4 – Disposal	100% of the product will be landfilled therefore no Module D benefits. The Module D benefits beyond the system boundaries have been calculated based on the packaging waste recycled/incinerated at the construction site during product installation.		
	Cardboard waste to recycling	kg	0.101
	Paper waste to recycling	kg	0.111
	Wood waste to incineration	kg	0.078
	Plastic waste to incineration	kg	0.002

Interpretation of results

The bulk of the environmental impacts and primary energy demand are attributed to the upstream manufacturing process, covered by information modules A1-A3 of EN15804:2012+A2:2019. The below chart illustrates the average GWP contributions of various processes per square meter, with adhesive production, rubber production contributing most of the impacts at the product manufacturing stage A1. Transport by lorry (A4) also contributes significantly, while primer production, Bitumen, packaging film production, electricity use, sea transport, and waste wood treatment, natural gas are comparatively lower. Overall, production processes in stage A1 dominate the GWP impact, highlighting the material manufacturing phase as the key contributor.
